APPROACH & METHODS COMBO

This report has been prepared for Combo Network to discover issues and vulnerabilities in the source code of the COMBO project as well as any contract dependencies that were not part of an officially recognized library. A comprehensive examination has been performed, utilizing Static Analysis and Manual Review techniques.

The auditing process pays special attention to the following considerations:

- Testing the smart contracts against both common and uncommon attack vectors.
- Assessing the codebase to ensure compliance with current best practices and industry standards.
- Ensuring contract logic meets the specifications and intentions of the client.
- Cross referencing contract structure and implementation against similar smart contracts produced by industry
- Thorough line-by-line manual review of the entire codebase by industry experts.

The security assessment resulted in findings that ranged from critical to informational. We recommend addressing these findings to ensure a high level of security standards and industry practices. We suggest recommendations that could better serve the project from the security perspective:

- Testing the smart contracts against both common and uncommon attack vectors;
- Enhance general coding practices for better structures of source codes;
- Add enough unit tests to cover the possible use cases;
- Provide more comments per each function for readability, especially contracts that are verified in public;
- Provide more transparency on privileged activities once the protocol is live.

FINDINGS COMBO

This report has been prepared to discover issues and vulnerabilities for COMBO. Through this audit, we have uncovered 3 issues ranging from different severity levels. Utilizing the techniques of Static Analysis & Manual Review to complement rigorous manual code reviews, we discovered the following findings:

ID	Title	Category	Severity	Status
CTT-05	Centralization Risks In ComboToken.Sol	Centralization / Privilege	Major	Unresolved
CTT-02	Incorrect Whitelist And Blacklist Check Intransfer() Function	Logical Issue	Minor	Resolved
CTT-04	Unclear Purpose Of withdrawFromContract() And	Logical Issue	Informational	Acknowledged
	_transfer()		2	

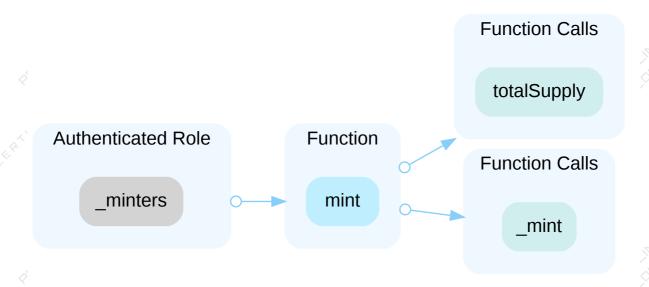

CTT-05 CENTRALIZATION RISKS IN COMBOTOKEN.SOL

Category	Severity	Location	Status
Centralization / Privilege	• Major	contracts/ComboToken.sol: 65, 87, 97, 101, 108, 121, 127, 133, 141, 149, 157	Pending

I Description

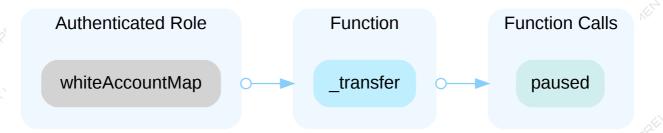

In the contract ComboToken the role _minters has authority over the functions shown in the diagram below.

In the contract ComboToken the role _owner has authority over the functions shown in the diagram below.

In the contract ComboToken the role whiteAccountMap has authority over the functions shown in the diagram below.

Any compromise to the privileged account may allow the hacker to take advantage of this authority:

- 1. withdrawFromContract() Allows the owner to withdraw tokens accidentally sent to the contract address.
- 2. pause() Allows the **owner** to pause the contract, restricting token transfers for non-whitelisted accounts.
- 3. unpause() Allows the **owner** to unpause the contract, resuming token transfers for all non-blacklisted accounts.
- 4. mint() Allows minters to mint new tokens and add them to the specified account's balance.
- 5. addMinter() Allows the **owner** to add a new minter address.
- 6. removeMinter() Allows the **owner** to remove a minter address.
- 7. addwhiteAccount() Allows the owner to add an account to the whitelist, allowing token transfers during a pause.
- 8. delWhiteAccount() Allows the **owner** to remove an account from the whitelist.
- 9. addBlackAccount() Allows the **owner** to add an account to the blacklist, restricting token transfers even when the contract is not paused.
- 10. delBlackAccount() Allows the **owner** to remove an account from the blacklist.
- **11**. _transfer() Allows the **whiteAccountMap** roel to transfer tokens.

Recommendation

The risk describes the current project design and potentially makes iterations to improve in the security operation and level of decentralization, which in most cases cannot be resolved entirely at the present stage. We advise the client to carefully manage the privileged account's private key to avoid any potential risks of being hacked. In general, we strongly recommend centralized privileges or roles in the protocol be improved via a decentralized mechanism or smart-contract-based accounts with enhanced security practices, e.g., multisignature wallets. Indicatively, here are some feasible suggestions that would also mitigate the potential risk at a different level in terms of short-term, long-term and permanent:

Short Term:

Timelock and Multi sign $(\frac{2}{3}, \frac{3}{5})$ combination *mitigate* by delaying the sensitive operation and avoiding a single point of key management failure.

Time-lock with reasonable latency, e.g., 48 hours, for awareness on privileged operations;
 AND

Assignment of privileged roles to multi-signature wallets to prevent a single point of failure due to the private key compromised;

AND

• A medium/blog link for sharing the timelock contract and multi-signers addresses information with the public audience.

Long Term:

Timelock and DAO, the combination, *mitigate* by applying decentralization and transparency.

- Time-lock with reasonable latency, e.g., 48 hours, for awareness on privileged operations;
- Introduction of a DAO/governance/voting module to increase transparency and user involvement.
- A medium/blog link for sharing the timelock contract, multi-signers addresses, and DAO information with the public audience.

Permanent:

Renouncing the ownership or removing the function can be considered fully resolved.

- Renounce the ownership and never claim back the privileged roles.
- Remove the risky functionality.

CTT-02 INCORRECT WHITELIST AND BLACKLIST CHECK IN _transfer() FUNCTION

Category	Severity	Location	Status
Logical Issue	Minor	contracts/ComboToken.sol: 87	Resolved

Description

The whitelist and blacklist checks in the <code>_transfer()</code> function are incorrect. The code that checks the whitelist and blacklist should verify whether the <code>from</code> addresses are in the whitelist or blacklist, rather than checking whether <code>msg.sender</code> is in the whitelist or blacklist.

Recommendation

We recommend making the following update to check the whitelist and blacklist correctly:

```
65 function _transfer(
66    address from,
67    address to,
68    uint256 value
69 ) internal override {
70    if (paused() == true) {
71         // only white list pass
72         require(whiteAccountMap[from], "'from' is not in the whitelist list");
73    } else {
74         // check black list
75         require(!blackAccountMap[from], "'from' is in the black list");
76    }
77    super._transfer(from, to, value);
78 }
```

Alleviation

[COMBO]: The team heeded the advice and resolved the finding in the commit 9a57b3eeb3c67f088f070604a99391339fe8bdae

CTT-04 UNCLEAR PURPOSE OF withdrawFromContract() AND _transfer()

Category	Severity	Location		Status
Logical Issue	Informational	contracts/ComboT	oken.sol: 93	Acknowledged

Description

In function withdrawFromContract(), current implementation would help transfer a certain amount contractBalance of token from address(this) to _to by invoking the _transfer() function. This function can only be called by owner role account. However there are validations in _transfer() to check if msg.sender would be in a whitelist or a blacklist. Since the owner would be the only caller and only potential msg.sender address, having whitelist/blacklist for a owner address cannot explicitly reveal the intentional design of the project.

Recommendation

We would like to confirm with the client about the design/purpose of the withdrawFromContract(), _transfer() and whiteAccountMap / blackAccountMap() use scenarios. These two functions would be reviewed again once the design has been clarified.

Alleviation

[COMBO]: To avoid errors in transferring to the token contract address, tokens transferred to the token contract address can be transferred out again.

OPTIMIZATIONS COMBO

	ID	Title	Category	Severity	Status
Q ⁽	CTT-01	Comparison To A Boolean Constant	Gas Optimization	Optimization	Resolved
	CTT-03	Unnecessary Use Of SafeMath	Gas Optimization	Optimization	Resolved

CTT-01 COMPARISON TO A BOOLEAN CONSTANT

Category	Severity	Location	Status
Gas Optimization	Optimization	contracts/ComboToken.sol: 70	Resolved

Description

A boolean is compared to a boolean constant as shown below:

```
70 if (paused() == true) {
```

Boolean constants can be used directly and do not need to be compared to true or false.

Recommendation

We advise removing the comparison to the boolean constant.

Alleviation

[Certik]: The team heeded the advice and resolved the finding in fcb723ee0d082fec0cf292fbeb34f3b4004f3518

CTT-03 UNNECESSARY USE OF SAFEMATH

Category	Severity	Location	Status
Gas Optimization	Optimization	contracts/ComboToken.sol: 114	Resolved

Description

The SafeMath library is used unnecessarily. With Solidity compiler versions 0.8.0 or newer, arithmetic operations will automatically revert in case of integer overflow or underflow.

```
using SafeMath for uint256;
```

• SafeMath library is used for uint256 type in ComboToken contract.

```
uint256 newMintSupply = totalSupply().add(amount);
```

• SafeMath.add is called in mint function of ComboToken contract.

Recommendation

We advise removing the usage of SafeMath library and using the built-in arithmetic operations provided by the Solidity programming language.

Alleviation

[Certik]: The team heeded the advice and resolved the finding in fcb723ee0d082fec0cf292fbeb34f3b4004f3518

FORMAL VERIFICATION COMBO

Formal guarantees about the behavior of smart contracts can be obtained by reasoning about properties relating to the entire contract (e.g. contract invariants) or to specific functions of the contract. Once such properties are proven to be valid, they guarantee that the contract behaves as specified by the property. As part of this audit, we applied automated formal verification (symbolic model checking) to prove that well-known functions in the smart contracts adhere to their expected behavior.

Considered Functions And Scope

In the following, we provide a description of the properties that have been used in this audit. They are grouped according to the type of contract they apply to.

Verification of ERC-20 Compliance

We verified properties of the public interface of those token contracts that implement the ERC-20 interface. This covers

- Functions transfer and transferFrom that are widely used for token transfers,
- functions approve and allowance that enable the owner of an account to delegate a certain subset of her tokens to another account (i.e. to grant an allowance), and
- the functions balanceOf and totalSupply, which are verified to correctly reflect the internal state of the contract

The properties that were considered within the scope of this audit are as follows:

Property Name	Title
erc20-transfer-correct-amount	transfer Transfers the Correct Amount in Non-self Transfers
erc20-transfer-revert-zero	transfer Prevents Transfers to the Zero Address
erc20-transfer-succeed-normal	transfer Succeeds on Admissible Non-self Transfers
erc20-transfer-succeed-self	transfer Succeeds on Admissible Self Transfers
rc20-transfer-correct-amount-self	transfer Transfers the Correct Amount in Self Transfers
rc20-transfer-change-state	transfer Has No Unexpected State Changes
rc20-transfer-exceed-balance	transfer Fails if Requested Amount Exceeds Available Balance
erc20-transfer-false	If transfer Returns false, the Contract State Is Not Changed
rc20-transfer-never-return-false	transfer Never Returns false
rc20-transferfrom-revert-from-zero	transferFrom Fails for Transfers From the Zero Address

Property Name	Title
erc20-transfer-recipient-overflow	transfer Prevents Overflows in the Recipient's Balance
erc20-transferfrom-revert-to-zero	transferFrom Fails for Transfers To the Zero Address
erc20-transferfrom-correct-amount	transferFrom Transfers the Correct Amount in Non-self Transfers
erc20-transferfrom-correct-amount-self	transferFrom Performs Self Transfers Correctly
erc20-transferfrom-succeed-self	transferFrom Succeeds on Admissible Self Transfers
erc20-transferfrom-succeed-normal	transferFrom Succeeds on Admissible Non-self Transfers
erc20-transferfrom-correct-allowance	transferFrom Updated the Allowance Correctly
erc20-transferfrom-fail-exceed-balance	transferFrom Fails if the Requested Amount Exceeds the Available Balance
erc20-transferfrom-fail-exceed-allowance	transferFrom Fails if the Requested Amount Exceeds the Available Allowance
erc20-transferfrom-false	If transferFrom Returns false, the Contract's State Is Unchanged
erc20-transferfrom-change-state	transferFrom Has No Unexpected State Changes
erc20-transferfrom-never-return-false	transferFrom Never Returns false
erc20-totalsupply-succeed-always	totalSupply Always Succeeds
erc20-totalsupply-correct-value	totalSupply Returns the Value of the Corresponding State Variable
erc20-totalsupply-change-state	totalSupply Does Not Change the Contract's State
erc20-balanceof-succeed-always	balanceOf Always Succeeds
erc20-transferfrom-fail-recipient-overflow	transferFrom Prevents Overflows in the Recipient's Balance
erc20-balanceof-correct-value	balance0f Returns the Correct Value
erc20-balanceof-change-state	balanceOf Does Not Change the Contract's State
erc20-allowance-succeed-always	allowance Always Succeeds
erc20-allowance-correct-value	allowance Returns Correct Value
erc20-allowance-change-state	allowance Does Not Change the Contract's State

Property Name	Title
erc20-approve-revert-zero	approve Prevents Approvals For the Zero Address
erc20-approve-succeed-normal	approve Succeeds for Admissible Inputs
erc20-approve-correct-amount	approve Updates the Approval Mapping Correctly
erc20-approve-change-state	approve Has No Unexpected State Changes
erc20-approve-false	If approve Returns false, the Contract's State Is Unchanged
erc20-approve-never-return-false	approve Never Returns false

Verification Results

In the remainder of this section, we list all contracts where model checking of at least one property was not successful. There are several reasons why this could happen:

- Model checking reports a counterexample that violates the property. Depending on the counterexample, this occurs if
 - The specification of the property is too generic and does not accurately capture the intended behavior of the smart contract. In that case, the counterexample does not indicate a problem in the underlying smart contract. We report such instances as being "inapplicable".
 - The property is applicable to the smart contract. In that case, the counterexample showcases a problem in the smart contract and a correspond finding is reported separately in the Findings section of this report. In the following tables, we report such instances as "invalid". The distinction between spurious and actual counterexamples is done manually by the auditors.
- The model checking result is inconclusive. Such a result does not indicate a problem in the underlying smart contract. An inconclusive result may occur if
 - The model checking engine fails to construct a proof. This can happen if the logical deductions
 necessary are beyond the capabilities of the automated reasoning tool. It is a technical limitation of all
 proof engines and cannot be avoided in general.
 - The model checking engine runs out of time or memory and did not produce a result. This can happen if automatic abstraction techniques are ineffective or of the state space is too big.

Detailed Results For Contract ComboToken (contracts/ComboToken.sol) In Commit d4b8a5c0d45cc0634ac18036883b9e28f1b38c49

APPENDIX COMBO

Finding Categories

7	Categories	Description	
Centralization / Privilege Gas Optimization		Centralization / Privilege findings refer to either feature logic or implementation of components that act against the nature of decentralization, such as explicit ownership or specialized access roles in combination with a mechanism to relocate funds. Gas Optimization findings do not affect the functionality of the code but generate different, more optimal EVM opcodes resulting in a reduction on the total gas cost of a transaction.	_
Logical Issue	Logical Issue findings detail a fault in the logic of the linked code, such as an incorrect notion on how block.timestamp works.		

Checksum Calculation Method

The "Checksum" field in the "Audit Scope" section is calculated as the SHA-256 (Secure Hash Algorithm 2 with digest size of 256 bits) digest of the content of each file hosted in the listed source repository under the specified commit.

The result is hexadecimal encoded and is the same as the output of the Linux "sha256sum" command against the target file

Details on Formal Verification

Some Solidity smart contracts from this project have been formally verified using symbolic model checking. Each such contract was compiled into a mathematical model which reflects all its possible behaviors with respect to the property. The model takes into account the semantics of the Solidity instructions found in the contract. All verification results that we report are based on that model.

Technical Description

The model also formalizes a simplified execution environment of the Ethereum blockchain and a verification harness that performs the initialization of the contract and all possible interactions with the contract. Initially, the contract state is initialized non-deterministically (i.e. by arbitrary values) and over-approximates the reachable state space of the contract throughout any actual deployment on chain. All valid results thus carry over to the contract's behavior in arbitrary states after it has been deployed.

Assumptions and Simplifications

The following assumptions and simplifications apply to our model:

- Gas consumption is not taken into account, i.e. we assume that executions do not terminate prematurely because they run out of gas.
- The contract's state variables are non-deterministically initialized before invocation of any function. That ignores contract invariants and may lead to false positives. It is, however, a safe over-approximation.
- The verification engine reasons about unbounded integers. Machine arithmetic is modeled using modular arithmetic based on the bit-width of the underlying numeric Solidity type. This ensures that over- and underflow characteristics are faithfully represented.
- Certain low-level calls and inline assembly are not supported and may lead to a contract not being formally verified
- We model the semantics of the Solidity source code and not the semantics of the EVM bytecode in a compiled contract.

Formalism for Property Specification

All properties are expressed in linear temporal logic (LTL). For that matter, we treat each invocation of and each return from a public or an external function as a discrete time step. Our analysis reasons about the contract's state upon entering and upon leaving public or external functions.

Apart from the Boolean connectives and the modal operators "always" (written []) and "eventually" (written <>>), we use the following predicates as atomic propositions. They are evaluated on the contract's state whenever a discrete time step occurs:

- started(f, [cond]) Indicates an invocation of contract function f within a state satisfying formula cond.
- willsucceed(f, [cond]) Indicates an invocation of contract function f within a state satisfying formula cond and considers only those executions that do not revert.
- finished(f, [cond]) Indicates that execution returns from contract function f in a state satisfying formula cond. Here, formula cond may refer to the contract's state variables and to the value they had upon entering the function (using the old function).
- reverted(f, [cond]) Indicates that execution of contract function f was interrupted by an exception in a contract state satisfying formula cond.

The verification performed in this audit operates on a harness that non-deterministically invokes a function of the contract's public or external interface. All formulas are analyzed w.r.t. the trace that corresponds to this function invocation.

Description of the Analyzed ERC-20 Properties

The specifications are designed such that they capture the desired and admissible behaviors of the ERC-20 functions transfer, transferFrom, approve, allowance, balanceOf, and totalSupply. In the following, we list those property specifications.

Properties related to function transfer

erc20-transfer-revert-zero

transfer Prevents Transfers to the Zero Address. Any call of the form transfer (recipient, amount) must fail if the

recipient address is the zero address. Specification:

erc20-transfer-succeed-normal

transfer Succeeds on Admissible Non-self Transfers. All invocations of the form transfer(recipient, amount) must succeed and return true if

- the recipient address is not the zero address,
- amount does not exceed the balance of address msg.sender
- transferring amount to the recipient address does not lead to an overflow of the recipient's balance, and
- the supplied gas suffices to complete the call. Specification:

erc20-transfer-succeed-self

transfer Succeeds on Admissible Self Transfers. All self-transfers, i.e. invocations of the form transfer(recipient, amount) where the recipient address equals the address in msg.sender must succeed and return true if

- the value in amount does not exceed the balance of msg.sender and
- the supplied gas suffices to complete the call. Specification:

erc20-transfer-correct-amount

transfer Transfers the Correct Amount in Non-self Transfers. All non-reverting invocations of transfer(recipient, amount) that return true must subtract the value in amount from the balance of msg.sender and add the same value to the balance of the recipient address. Specification:

erc20-transfer-correct-amount-self

transfer Transfers the Correct Amount in Self Transfers. All non-reverting invocations of transfer(recipient, amount) that return true and where the recipient address equals msg.sender (i.e. self-transfers) must not change the balance of address msg.sender. Specification:

erc20-transfer-change-state

transfer Has No Unexpected State Changes. All non-reverting invocations of transfer(recipient, amount) that return must only modify the balance entries of the msg.sender and the recipient addresses. Specification:

erc20-transfer-exceed-balance

transfer Fails if Requested Amount Exceeds Available Balance. Any transfer of an amount of tokens that exceeds the balance of msg.sender must fail. Specification:

transfer Prevents Overflows in the Recipient's Balance. Any invocation of transfer(recipient, amount) must fail if it causes the balance of the recipient address to overflow. Specification:

erc20-transfer-false

If transfer Returns false, the Contract State Is Not Changed. If the transfer function in contract contract fails by returning false, it must undo all state changes it incurred before returning to the caller. Specification:

```
[](willSucceed(contract.transfer(to, value)) ==> <>(finished(contract.transfer(to, value), return == false ==> (_balances == old(_balances) && _totalSupply == old(_totalSupply) && _allowances == old(_allowances) && other_state_variables == old(other_state_variables)))))
```

erc20-transfer-never-return-false

transfer Never Returns | false |. The transfer function must never return | false | to signal a failure. Specification:

```
[](!(finished(contract.transfer, return == false)))
```

Properties related to function transferFrom

erc20-transferfrom-revert-from-zero

transferFrom Fails for Transfers From the Zero Address. All calls of the form transferFrom(from, dest, amount) where the from address is zero, must fail. Specification:

```
[](started(contract.transferFrom(from, to, value), from == address(0)) ==>
    <>(reverted(contract.transferFrom) || finished(contract.transferFrom, return ==
    false)))
```

erc20-transferfrom-revert-to-zero

transferFrom Fails for Transfers To the Zero Address. All calls of the form transferFrom(from, dest, amount) where the dest address is zero, must fail. Specification:

erc20-transferfrom-succeed-normal

transferFrom Succeeds on Admissible Non-self Transfers. All invocations of transferFrom(from, dest, amount) must succeed and return true if

- the value of amount does not exceed the balance of address from,
- the value of amount does not exceed the allowance of msg.sender for address from ,
- transferring a value of amount to the address in dest does not lead to an overflow of the recipient's balance, and
- the supplied gas suffices to complete the call. Specification:

erc20-transferfrom-succeed-self

transferFrom Succeeds on Admissible Self Transfers. All invocations of transferFrom(from, dest, amount) where the dest address equals the from address (i.e. self-transfers) must succeed and return true if:

- The value of amount does not exceed the balance of address from ,
- the value of amount does not exceed the allowance of msg. sender for address from , and
- the supplied gas suffices to complete the call. Specification:

transferFrom Transfers the Correct Amount in Non-self Transfers. All invocations of transferFrom(from, dest, amount) that succeed and that return true subtract the value in amount from the balance of address from and add the same value to the balance of address dest. Specification:

erc20-transferfrom-correct-amount-self

transferFrom Performs Self Transfers Correctly. All non-reverting invocations of transferFrom(from, dest, amount) that return true and where the address in from equals the address in dest (i.e. self-transfers) do not change the balance entry of the from address (which equals dest). Specification:

erc20-transferfrom-correct-allowance

transferFrom Updated the Allowance Correctly. All non-reverting invocations of transferFrom(from, dest, amount) that return true must decrease the allowance for address msg.sender over address from by the value in amount. Specification:

erc20-transferfrom-change-state

transferFrom Has No Unexpected State Changes. All non-reverting invocations of transferFrom(from, dest, amount) that return true may only modify the following state variables:

- The balance entry for the address in dest
- The balance entry for the address in from ,
- The allowance for the address in msg. sender for the address in from. Specification:

erc20-transferfrom-fail-exceed-balance

transferFrom Fails if the Requested Amount Exceeds the Available Balance. Any call of the form transferFrom(from, dest, amount) with a value for amount that exceeds the balance of address from must fail. Specification:

erc20-transferfrom-fail-exceed-allowance

transferFrom Fails if the Requested Amount Exceeds the Available Allowance. Any call of the form transferFrom(from, dest, amount) with a value for amount that exceeds the allowance of address msg.sender must fail. Specification:

erc20-transferfrom-fail-recipient-overflow

transferFrom Prevents Overflows in the Recipient's Balance. Any call of transferFrom(from, dest, amount) with a value in amount whose transfer would cause an overflow of the balance of address dest must fail. Specification:

erc20-transferfrom-false

If transferFrom Returns false, the Contract's State Is Unchanged. If transferFrom returns false to signal a failure, it must undo all incurred state changes before returning to the caller. Specification:

```
[](willSucceed(contract.transferFrom(from, to, value)) ==>
    <>(finished(contract.transferFrom(from, to, value), return == false ==>
      (_balances == old(_balances) && _totalSupply == old(_totalSupply) &&
      _allowances == old(_allowances) && other_state_variables ==
      old(other_state_variables)))))
```

erc20-transferfrom-never-return-false

transferFrom Never Returns false . The transferFrom function must never return false . Specification:

```
[](!(finished(contract.transferFrom, return == false)))
```

Properties related to function totalSupply

erc20-totalsupply-succeed-always

totalSupply Always Succeeds. The function totalSupply must always succeeds, assuming that its execution does not run out of gas. Specification:

```
[](started(contract.totalSupply) ==> <>(finished(contract.totalSupply)))
```

erc20-totalsupply-correct-value

totalSupply Returns the Value of the Corresponding State Variable. The totalSupply function must return the value that is held in the corresponding state variable of contract contract. Specification:

totalsupply Does Not Change the Contract's State. The totalsupply function in contract contract must not change any state variables. Specification:

Properties related to function balanceOf

erc20-balanceof-succeed-always

balanceOf Always Succeeds. Function balanceOf must always succeed if it does not run out of gas. Specification:

```
[](started(contract.balanceOf) ==> <>(finished(contract.balanceOf)))
```

erc20-balanceof-correct-value

balanceOf Returns the Correct Value. Invocations of balanceOf(owner) must return the value that is held in the contract's balance mapping for address owner. Specification:

erc20-balanceof-change-state

balanceOf Does Not Change the Contract's State. Function balanceOf must not change any of the contract's state variables. Specification:

Properties related to function allowance

erc20-allowance-succeed-always

allowance Always Succeeds. Function allowance must always succeed, assuming that its execution does not run out of gas. Specification:

```
[](started(contract.allowance) ==> <>(finished(contract.allowance)))
```

allowance Returns Correct Value. Invocations of allowance(owner, spender) must return the allowance that address spender has over tokens held by address owner. Specification:

erc20-allowance-change-state

allowance Does Not Change the Contract's State. Function allowance must not change any of the contract's state variables. Specification:

```
[](willSucceed(contract.allowance(owner, spender)) ==>
    <>(finished(contract.allowance(owner, spender), _totalSupply == old(_totalSupply)
    && _balances == old(_balances) && _allowances == old(_allowances) &&
    other_state_variables == old(other_state_variables))))
```

Properties related to function approve

erc20-approve-revert-zero

approve Prevents Approvals For the Zero Address. All calls of the form approve(spender, amount) must fail if the address in spender is the zero address. Specification:

```
[](started(contract.approve(spender, value), spender == address(0)) ==>
  <>(reverted(contract.approve) || finished(contract.approve(spender, value),
    return == false)))
```

erc20-approve-succeed-normal

approve Succeeds for Admissible Inputs. All calls of the form approve(spender, amount) must succeed, if

- the address in spender is not the zero address and
- the execution does not run out of gas. Specification:

```
[](started(contract.approve(spender, value), spender != address(0)) ==>
  <>(finished(contract.approve(spender, value), return == true)))
```

erc20-approve-correct-amount

approve Updates the Approval Mapping Correctly. All non-reverting calls of the form approve(spender, amount) that return true must correctly update the allowance mapping according to the address msg.sender and the values of spender and amount. Specification:

erc20-approve-change-state

approve Has No Unexpected State Changes. All calls of the form approve(spender, amount) must only update the allowance mapping according to the address msg.sender and the values of spender and amount and incur no other state changes. Specification:

```
[](willSucceed(contract.approve(spender, value), spender != address(0) && (p1 !=
    msg.sender || p2 != spender)) ==> <>(finished(contract.approve(spender,
        value), return == true ==> _totalSupply == old(_totalSupply) && _balances
        == old(_balances) && _allowances[p1][p2] == old(_allowances[p1][p2]) &&
        other_state_variables == old(other_state_variables))))
```

erc20-approve-false

If approve Returns false, the Contract's State Is Unchanged. If function approve returns false to signal a failure, it must undo all state changes that it incurred before returning to the caller. Specification:

```
[](willSucceed(contract.approve(spender, value)) ==>
     <>(finished(contract.approve(spender, value), return == false ==> (_balances ==
        old(_balances) && _totalSupply == old(_totalSupply) && _allowances ==
        old(_allowances) && other_state_variables == old(other_state_variables)))))
```

erc20-approve-never-return-false

approve Never Returns false . The function approve must never returns false . Specification:

```
[](!(finished(contract.approve, return == false)))
```

DISCLAIMER CERTIK

This report is subject to the terms and conditions (including without limitation, description of services, confidentiality, disclaimer and limitation of liability) set forth in the Services Agreement, or the scope of services, and terms and conditions provided to you ("Customer" or the "Company") in connection with the Agreement. This report provided in connection with the Services set forth in the Agreement shall be used by the Company only to the extent permitted under the terms and conditions set forth in the Agreement. This report may not be transmitted, disclosed, referred to or relied upon by any person for any purposes, nor may copies be delivered to any other person other than the Company, without CertiK's prior written consent in each instance.

This report is not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. This report is not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team or project that contracts CertiK to perform a security assessment. This report does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors, business, business model or legal compliance.

This report should not be used in any way to make decisions around investment or involvement with any particular project. This report in no way provides investment advice, nor should be leveraged as investment advice of any sort. This report represents an extensive assessing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk. CertiK's position is that each company and individual are responsible for their own due diligence and continuous security. CertiK's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies, and in no way claims any guarantee of security or functionality of the technology we agree to analyze.

The assessment services provided by CertiK is subject to dependencies and under continuing development. You agree that your access and/or use, including but not limited to any services, reports, and materials, will be at your sole risk on an as-is, where-is, and as-available basis. Cryptographic tokens are emergent technologies and carry with them high levels of technical risk and uncertainty. The assessment reports could include false positives, false negatives, and other unpredictable results. The services may access, and depend upon, multiple layers of third-parties.

ALL SERVICES, THE LABELS, THE ASSESSMENT REPORT, WORK PRODUCT, OR OTHER MATERIALS, OR ANY PRODUCTS OR RESULTS OF THE USE THEREOF ARE PROVIDED "AS IS" AND "AS AVAILABLE" AND WITH ALL FAULTS AND DEFECTS WITHOUT WARRANTY OF ANY KIND. TO THE MAXIMUM EXTENT PERMITTED UNDER APPLICABLE LAW, CERTIK HEREBY DISCLAIMS ALL WARRANTIES, WHETHER EXPRESS, IMPLIED, STATUTORY, OR OTHERWISE WITH RESPECT TO THE SERVICES, ASSESSMENT REPORT, OR OTHER MATERIALS. WITHOUT LIMITING THE FOREGOING, CERTIK SPECIFICALLY DISCLAIMS ALL IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE AND NON-INFRINGEMENT, AND ALL WARRANTIES ARISING FROM COURSE OF DEALING, USAGE, OR TRADE PRACTICE. WITHOUT LIMITING THE FOREGOING, CERTIK MAKES NO WARRANTY OF ANY KIND THAT THE SERVICES, THE LABELS, THE ASSESSMENT REPORT, WORK PRODUCT, OR OTHER MATERIALS, OR ANY PRODUCTS OR RESULTS OF THE USE THEREOF, WILL MEET CUSTOMER'S OR ANY OTHER PERSON'S REQUIREMENTS, ACHIEVE ANY INTENDED RESULT, BE COMPATIBLE OR WORK WITH ANY SOFTWARE, SYSTEM, OR OTHER SERVICES, OR BE SECURE, ACCURATE, COMPLETE, FREE OF HARMFUL CODE, OR ERROR-FREE. WITHOUT LIMITATION TO THE FOREGOING, CERTIK PROVIDES NO WARRANTY OR

UNDERTAKING, AND MAKES NO REPRESENTATION OF ANY KIND THAT THE SERVICE WILL MEET CUSTOMER'S REQUIREMENTS, ACHIEVE ANY INTENDED RESULTS, BE COMPATIBLE OR WORK WITH ANY OTHER SOFTWARE, APPLICATIONS, SYSTEMS OR SERVICES, OPERATE WITHOUT INTERRUPTION, MEET ANY PERFORMANCE OR RELIABILITY STANDARDS OR BE ERROR FREE OR THAT ANY ERRORS OR DEFECTS CAN OR WILL BE CORRECTED.

WITHOUT LIMITING THE FOREGOING, NEITHER CERTIK NOR ANY OF CERTIK'S AGENTS MAKES ANY REPRESENTATION OR WARRANTY OF ANY KIND, EXPRESS OR IMPLIED AS TO THE ACCURACY, RELIABILITY, OR CURRENCY OF ANY INFORMATION OR CONTENT PROVIDED THROUGH THE SERVICE. CERTIK WILL ASSUME NO LIABILITY OR RESPONSIBILITY FOR (I) ANY ERRORS, MISTAKES, OR INACCURACIES OF CONTENT AND MATERIALS OR FOR ANY LOSS OR DAMAGE OF ANY KIND INCURRED AS A RESULT OF THE USE OF ANY CONTENT, OR (II) ANY PERSONAL INJURY OR PROPERTY DAMAGE, OF ANY NATURE WHATSOEVER, RESULTING FROM CUSTOMER'S ACCESS TO OR USE OF THE SERVICES, ASSESSMENT REPORT, OR OTHER MATERIALS.

ALL THIRD-PARTY MATERIALS ARE PROVIDED "AS IS" AND ANY REPRESENTATION OR WARRANTY OF OR CONCERNING ANY THIRD-PARTY MATERIALS IS STRICTLY BETWEEN CUSTOMER AND THE THIRD-PARTY OWNER OR DISTRIBUTOR OF THE THIRD-PARTY MATERIALS.

THE SERVICES, ASSESSMENT REPORT, AND ANY OTHER MATERIALS HEREUNDER ARE SOLELY PROVIDED TO CUSTOMER AND MAY NOT BE RELIED ON BY ANY OTHER PERSON OR FOR ANY PURPOSE NOT SPECIFICALLY IDENTIFIED IN THIS AGREEMENT, NOR MAY COPIES BE DELIVERED TO, ANY OTHER PERSON WITHOUT CERTIK'S PRIOR WRITTEN CONSENT IN EACH INSTANCE.

NO THIRD PARTY OR ANYONE ACTING ON BEHALF OF ANY THEREOF, SHALL BE A THIRD PARTY OR OTHER BENEFICIARY OF SUCH SERVICES, ASSESSMENT REPORT, AND ANY ACCOMPANYING MATERIALS AND NO SUCH THIRD PARTY SHALL HAVE ANY RIGHTS OF CONTRIBUTION AGAINST CERTIK WITH RESPECT TO SUCH SERVICES, ASSESSMENT REPORT, AND ANY ACCOMPANYING MATERIALS.

THE REPRESENTATIONS AND WARRANTIES OF CERTIK CONTAINED IN THIS AGREEMENT ARE SOLELY FOR THE BENEFIT OF CUSTOMER. ACCORDINGLY, NO THIRD PARTY OR ANYONE ACTING ON BEHALF OF ANY THEREOF, SHALL BE A THIRD PARTY OR OTHER BENEFICIARY OF SUCH REPRESENTATIONS AND WARRANTIES AND NO SUCH THIRD PARTY SHALL HAVE ANY RIGHTS OF CONTRIBUTION AGAINST CERTIK WITH RESPECT TO SUCH REPRESENTATIONS OR WARRANTIES OR ANY MATTER SUBJECT TO OR RESULTING IN INDEMNIFICATION UNDER THIS AGREEMENT OR OTHERWISE.

FOR AVOIDANCE OF DOUBT, THE SERVICES, INCLUDING ANY ASSOCIATED ASSESSMENT REPORTS OR MATERIALS, SHALL NOT BE CONSIDERED OR RELIED UPON AS ANY FORM OF FINANCIAL, TAX, LEGAL, REGULATORY, OR OTHER ADVICE.

CertiK Securing the Web3 World

Founded in 2017 by leading academics in the field of Computer Science from both Yale and Columbia University, CertiK is a leading blockchain security company that serves to verify the security and correctness of smart contracts and blockchain-based protocols. Through the utilization of our world-class technical expertise, alongside our proprietary, innovative tech, we're able to support the success of our clients with best-in-class security, all whilst realizing our overarching vision; provable trust for all throughout all facets of blockchain.
